

CCEM 104 Finance & Governance for Green Energy Systems

OVERVIEW This course will introduce the variety of ownership options available for green energy systems and provide guidance on how system governance can be established to support project goals. Course content includes:

- The business side of energy – legal frameworks, governance and decision rights, types of investment and returns
- Evaluating municipal or private ownership or partnerships
- Typical project risks and how to overcome them
- Ownership options: advantages and disadvantages
- Considerations for establishing project operational governance
- Lessons learned from owners/operators of existing green energy systems

Flexible schedule for summer vacations

OUTCOMES Detailed case studies will outline how project planning and construction have been funded as well as operational challenges met and overcome. After completing this course, students will understand the pros and cons of green energy project ownership options and be well prepared for project implementation.

REQUIREMENTS This course includes an interactive webinar (adjusted for time zones), on-line learning, guided independent reading and video review, peer interaction and periodic quizzes/examinations.

INSTRUCTORS Our multi-disciplinary instruction team has over 50 years of combined experience with communities, climate, and energy.

PRE-REQUISITES CCEM 101 (or equivalent level of experience) is recommended.
